

Planning & Equipping

Your partner for the orthopaedic and orthopaedic footwear specialism workshop

Quality for life

Ideal conditions For your performance

Product expertise, when properly understood, isn't just limited to the fabrication process. It also includes a knowledge of the correct processing and use of products, efficient workflows in orthopaedic workshops and modern methods.

Ottobock has already used its extensive expertise in more than 2,400 projects at home and abroad to benefit O&P professionals and their patients, plan workshops, deliver machinery and materials and equip them with all the necessary devices. This is what end-to-end consulting looks like.

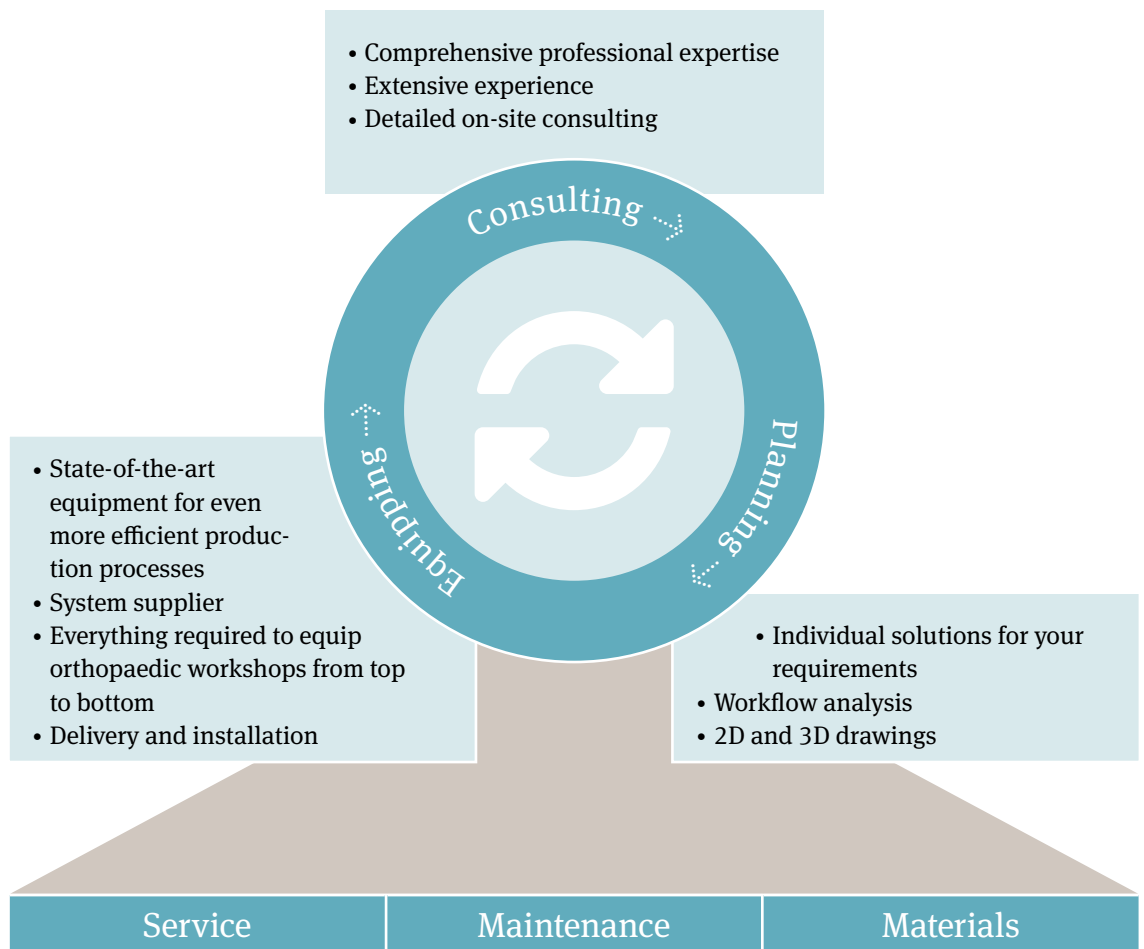

Our aim is to enable our partners to not only fabricate and repair quality products but also provide the best possible service in their profession.

What we offer you

Planning & Equipping is your expert partner for a smooth-running, efficient orthopaedic workshop. Whether you're planning a new building, making renovations or simply upgrading individual pieces of equipment, we can support you by supplying and installing the machines and equipment you need for an efficient workshop.

But our support doesn't end there. We provide you with all the materials required to produce orthopaedic products as well as the consumables for your machines and workshop.

Consulting

During an on-site consultation, our technical consultant works with you and your architect to record all the relevant data and requirements. Based on this, the consultant then works with our specialists to develop your personal, individual and sustainable solution.

We also take financial considerations into account in the design and planning.

For example, it may be useful for space or cost reasons to use individual sections of your workshop for several applications or to divide a project into city centre branches with a central workshop on an industrial estate. The primary aim is to reduce fitting and repair costs in accordance with practical requirements.

But our consulting services don't end with the planning of your new building or renovation. We would also be happy to advise you on technical issues relating to your machines and workshop equipment.

Planning

Our consultants have an in-depth insight into your specific requirements, ensuring that your building project is a success from the outset. We take this approach because we know that individual workflows are shaped by your company's internal structures. And these structures, in turn, determine the overall planning of your workshop equipment down to the smallest details – regardless of whether it's an individual workspace or all the workshop equipment. That's why our planning takes shape based on 2D and 3D models even before the implementation begins.

We can also conduct a workflow analysis upon request. To this end, we speak with you and your technicians, analyse the process steps on site and then prepare a workshop plan that meets your requirements. Our main objective is to support the orthopaedic technician by optimising the workflow and work environment in the orthopaedic workshop so the finished products fully meet the high demands patients place on quality.

Equipping

As a system supplier, we provide everything you need for your orthopaedic workshop. In addition to the products, we offer you delivery, installation, commissioning and training on all machines, equipment and tools as well as high-quality consumables. Our goal is to make your production processes even more efficient.

That's why we develop powerful machines and workshop equipment that meet the highest standards.

Our own production facilities and paint shop let us implement your individual wishes and needs precisely. Based on our consultants' expertise, we are also happy to provide you with personal support when setting up your "dream" workshop. Our aim is to guarantee that you and your employees feel completely comfortable – and can produce the best result for your customers and patients every day.

Our workstations and machines are developed or selected according to the state of the art and comply with occupational health and safety requirements as well as the necessary ergonomic aspects.

Service, maintenance and materials

We continue to support the smooth operation of your business even after the initial startup. On-site service and maintenance are just as much a part of what we do as the prompt delivery of all wear and tear and spare parts.

We provide you with all the materials you need in your workshop to produce orthopaedic products of the very highest quality. This lets you dedicate your full attention to producing your orthopaedic products.

Please contact us if you have any further questions or would like more information.
